- [1.0] The util.xsl now uses the PageEnvelope class the get most of its information. It could be cleaned up very much now. There are new tags that it'll recognize now. - [1.0] Changed the interface of ParentChildCreatorInterface: The create method no longer takes a Parameter argument but a more general Map. This way the action can pass in arbitrary Objects to the create method and ultimatively to the transformXML methods. The action now grabs all request, sitemap and session parameter and fills them into a map which is then passed along to the create method which hands it down to the transform method. the standard behaviour. It uses the template pattern, e.g. the create method basically just reads the template file invokes an (empty) transform method on the DOM node and finally writes it back. So subclasses can specify a transform method e.g. replace the title with the childName etc. 3. All classes make use of this and are therefore much smaller. 4. The create method now takes an additional argument 'parameters' which can be used to pass arbitrary arguments. This arg is passed to the transform method where it could be used to read things like the current user, etc. Diff (http://svn.apache.org/viewcvs.cgi?rev=38896&view=rev) (egli)
