

# The PageEnvelopeModule

by Andreas Hartmann

## 1. Overview

The `PageEnvelopeModule` is an `InputModule` that provides access to the `PageEnvelope` parameters. For documentation on input modules see section [Modules](#) of the Cocoon documentation.

## 2. Module Parameters

**publication-id**

The current publication ID.

**context-prefix**

The context prefix of the web application, e.g. `/lenya`.

**area**

The CMS area, `authoring` or `live`.

**publication**

The current publication

**document-id**

The document ID, i.e. the path of the document in the sitetree.

**document-url**

The URL of the document within the area, e.g., `/news/index.html`

**document-path**

The file path where this document is physically located in the file system.

**document-language**

The language of this document.

## 3. Sitemap usage

```
<map:parameter name="document-id" value="{page-envelope:document-id}"/>
```

## 4. XSP usage

```
<xsp:page
  language="java"
  xmlns:xsp="http://apache.org/xsp"
  xmlns:input="http://apache.org/cocoon/xsp/input/1.0">

<usecase:url>
  <input:get-attribute
    module="page-envelope" as="string" name="document-url"/>
</usecase:url>

</xsp:page>
```
