

The PageEnvelopeModule

by Andreas Hartmann

1. Overview

The `PageEnvelopeModule` is an `InputModule` that provides access to the `PageEnvelope` parameters. For documentation on input modules see section [Modules](#) of the Cocoon documentation.

2. Module Parameters

publication-id

The current publication ID.

context-prefix

The context prefix of the web application, e.g. `/lenya`.

area

The CMS area, `authoring` or `live`.

publication

The current publication

document-id

The document ID, i.e. the path of the document in the sitetree.

document-url

The URL of the document within the area, e.g., `/news/index.html`

document-path

The file path where this document is physically located in the file system.

document-language

The language of this document.

document-type

The document type.

3. Sitemap usage

```
<map:parameter name="document-id" value="{page-envelope:document-id}"/>
```

4. XSP usage

```
<xsp:page
  language="java"
  xmlns:xsp="http://apache.org/xsp"
  xmlns:input="http://apache.org/cocoon/xsp/input/1.0">

<usecase:url>
  <input:get-attribute
    module="page-envelope" as="string" name="document-url"/>
</usecase:url>

</xsp:page>
```
