1. Serving Static Resources

Lenya now serves static resources out of the box. Publications can either use these predefined mappings, or provide their own. The following MIME types are handled:

- CSS
- Javascript
- Images (GIF, JPEG and PNG)
- PDF
- Shockwave Flash (*.swf)

To use the built-in matching, these resources need to be stored in the appropriate directories within a publication, and called with the proper URLs.

MIME Type	Prefix	Directory
CSS	css/	resources/css/
Javascript	javascript/	resources/javascript/
Images	images/	resources/images/
PDF	pdf/	resources/pdf/
Flash	flash/	resources/flash/

An image would thus be called with `` You don't have to worry about absolute vs relative image paths as long as you use URLs that follow this pattern.
