

Prerequisites

0.1 Documentation

by Lenya community

The following list describes the setup that is tested and recommended. Please note that you can use other servlet containers as well, but Jetty and Tomcat are the tested ones.

- **Java 2 Platform, Standard Edition** (required: J2SE 1.4.2 or newer)
<http://java.sun.com/j2se/1.4.2/download.html>
- **Apache Cocoon** (required: Cocoon 2.1.5)
[Cocoon download page](http://cocoon.apache.org/mirror.cgi) (<http://cocoon.apache.org/mirror.cgi>) Note that Cocoon is needed when building the source version of Lenya, but the resulting Lenya webapp is completely self contained and therefore it does not need the Cocoon webapp to be installed. See the [FAQ](http://wiki.apache.org/cocoon-lenya/FAQ) (<http://wiki.apache.org/cocoon-lenya/FAQ>) for details of configuration changes required when running multiple Cocoon based applications.
- **(optional) Apache Tomcat** for JDK 1.4 (recommended: 5.0.28 or newer)
[Tomcat release builds](http://jakarta.apache.org/site/binindex.cgi) (<http://jakarta.apache.org/site/binindex.cgi>) Note that Lenya ships with [Jetty](http://jetty.mortbay.org/jetty/) (<http://jetty.mortbay.org/jetty/>) and therefore does not need a servlet container to be installed.
