## Questions

### 1. Customizing Access Control

#### 1.1. How can I store my users in a database?

You have to implement a *UserManager* which accesses the database to obtain the user information. Additionally, you have to implement an *AccreditableManager* which uses this *UserManager*. This *AccreditableManager* has to be declared in `cocoon.xconf` and assigned to your *AccessController* in `lenya/pubs/mypub/config/ac/ac.xconf`.
