5 File Locations	
6 Example	••• 4

The org.apache.lenya.cms.task.AntTask class can be used to invoke targets of an Ant project.

1. Task Parameters

The task parameters are:

- publication-id: The publication ID
- **buildfile** (optional): The location of the build file relative to the publication directory. If this parameter is not provided, the file is loaded from the default location (see section <u>File Locations</u>).
- target (optional): The build target. If this parameter is not provided, the default target is executed.
- **properties.***: The project properties.
- ant.*: The command-line parameters for Ant (not implemented yet!)

2. Logging

Every time an AntTask is invoked, a log file is created unsing the XmlLogger (<u>manual entry</u>, <u>JavaDoc</u>). For the location of the log files, see section <u>File Locations</u>. The log history can be viewed at the URI

http://.../<publication>/logs/tasks/index.html

3. Writing AntTask Buildfiles

Any Ant project file can be used as a buildfile for the AntTask. There is one implicit property that is always set when an AntTask is executed:

• **pub.dir**: The absolute path of publication directory.

The runtime properties of the target can be set using task parameters with the prefix properties, e.g. properties.filename for a buildfile property named filename.

4. Using custom Ant Tasks

The implementation of custom Ant tasks is described in the <u>Ant User Manual</u>. If you want to write a general Lenya task, put it into the package org.lenya.cms.ant. If you want to write a task that is only suited for your publication, put it in the <publication>/java/src/directory.

5. File Locations

Default buildfile location:

<publication>/config/tasks/targets.xml

Log files:

<publication>/logs/tasks/*.xml

Log file presentation stylesheets:

<webapp>/lenya/xslt/logs/*.xsl

6. Example

The following buildfile contains the target publish that can be invoked using the AntTask:

You define the task in your tasks.xconf file:

```
<task id="ant" class="org.lenya.cms.task.AntTask"/>
```

To invoke the task from your sitemap, you have to define an appropriate TaskAction instance:

```
<map:action name="publish"
    src="org.lenya.cms.cocoon.acting.TaskAction">
    <task id="ant"/>
</map:action>
```

You call the action in a pipeline:

And finally, go to your browser and call the URI with the appropriate parameter(s):

http://.../publish.html?properties.publish.sources=test.xml
