The languageselector Module

Table of contents

1. Introduction

The `languageselector` module provides an XHTML widget to switch languages on a website.

2. Call Syntax

To generate a language selector widget, you use the following URL syntax:

```
cocoon://modules/languageselector/text-{text}/flagsize-{flagsize}
```

The URL contains the following parameters:

text

The *text* parameter can take the following values:

- *abbr*: abbreviated language

- *long*: full i18nized name of the language

flagsize

The *flagsize* parameter can take the following values:

- any number: the width of the flag image in pixels

- *none*: don't show the flag image

3. Adding Custom Flags

More flags can be obtained from Wikipedia
(http://en.wikipedia.org/wiki/Gallery_of_sovereign_state_flags) .

Be sure to rename them according to `<two-letter-language-code>.svg`.
