The PageEnvelopeModule

by Andreas Hartmann

1. Overview

The `PageEnvelopeModule` is an `InputModule` that provides access to the `PageEnvelope` parameters. For documentation on input modules see section [Modules](#) of the Cocoon documentation.

2. Module Parameters

publication-id
The current publication ID.
context-prefix
The context prefix of the web application, e.g. `/lenya`.
area
The CMS area, `authoring` or `live`.
document-id
The document ID, i.e. the path of the document in the sitetree.
document-url
The URL of the document within the area, e.g., `/news/index.html`

3. Sitemap usage

```
<map:parameter name="document-id" value="{page-envelope:document-id}"/>
```

4. XSP usage

```
<xsp:page
      language="java"
      xmlns:xsp="http://apache.org/xsp"
      xmlns:input="http://apache.org/cocoon/xsp/input/1.0">

<usecase:url>
  <input:get-attribute
      module="page-envelope" as="string" name="document-url"/>
```

```
</usecase:url>

</xsp:page>
```
